

5

Project Development Phase

This phase involves actual coding, implementation and integration of the system based on the design and planning created in the previous phases.

5.1 Overview

The Project Development Phase is the core phase where the actual system is built. Developers write the code, implement business logic, integrate different modules and ensure that the application works as per the requirements and design.

5.2 Objectives

- To build the system based on the design and requirements.
- To implement all the required features and functionalities.
- To integrate different modules and components.
- To ensure proper code structure, reusability and maintainability.
- To follow coding standards and best practices.

5.3 Activities Performed

- Set up the development environment (tools, IDE, database, etc.)
- Write and test the source code for each module.
- Integrate front-end and back-end components.
- Handle data storage and retrieval.
- Perform unit testing during development.
- Fix bugs and improve performance.

5.4 Development Process

1. Code Development

Write clean and efficient code based on the design.

2. Module Integration

Integrate all modules and components of the system.

3. Unit Testing

Test each module for functionality and errors.

4. Bug Fixing

Resolve issues and improve code performance.

5. Build Deployment Ready

Prepare the project for the next phase (Testing).

5.5 Technologies / Tools Used

VS Code
(IDE)

Git
(Version Control)

MySQL
(Database)

Web Browser
(Testing)

Framework
(e.g., Laravel/React/
Django etc.)

5.6 Output

- Fully functional and integrated system ready for testing.
